## The Liar Paradox

University of Tabriz & IPM Talk I: Paradoxes and their Theorems http://SaeedSalehi.ir/ 1 June 2016

## The Liar Paradox

#### $\mathfrak{L}$ : The Sentence $\mathcal{L}$ is Untrue.

University of Tabriz & IPM Talk I: Paradoxes and their Theorems http://SaeedSalehi.ir/ 1 June 2016

## The Liar Paradox

#### $\mathfrak{L}$ : The Sentence $\mathcal{L}$ is Untrue.

Or,  $\mathfrak{L}$  is True if and only if  $\mathfrak{L}$  is Untrue.

So,  $\mathfrak{L} \Longleftrightarrow \neg \mathfrak{L}$ 

University of Tabriz & IPM

Talk I: Paradoxes and their Theorems

http://SaeedSalehi.ir/ 1 June 2016

## The Liar Paradox

#### $\mathfrak{L}$ : The Sentence $\mathfrak{L}$ is Untrue.

Or,  $\mathfrak L$  is True if and only if  $\mathfrak L$  is Untrue. So,  $\mathfrak L \Longleftrightarrow \neg \mathfrak L$ Propositional Logic  $\vdash \neg (p \longleftrightarrow \neg p)$ .

#### Theorem (Tarski

If all the formulas can be coded by some terms in a language  $\mathcal{L}$   $(\#\colon \mathcal{L}\text{-Formulas} \to \mathcal{L}\text{-Terms}, \varphi \mapsto \#\varphi)$  and the diagonal lemma holds for a consistent  $\mathcal{L}\text{-theory }T$  (for any  $\Psi(x)\in\mathcal{L}\text{-Formulas}$  there is some  $\psi\in\mathcal{L}\text{-Sentences}$  such that  $T\vdash\psi\leftrightarrow\Psi(\#\psi)$ ) then there can be no truth predicate in  $\mathcal{L}$  for T (an  $\mathcal{L}\text{-formula}$   $\mathbb{T}(x)$  such that for any  $\varphi\in\mathcal{L}\text{-Sentences}$ ,  $T\vdash\varphi\leftrightarrow\mathbb{T}(\#\varphi)$ ).

#### Proof.

Take  $\mathcal{L}$  to be the diagonal sentence of  $\neg \mathbf{T}(x)$ . Then  $T \vdash \mathcal{L} \longleftrightarrow \neg \mathbf{T}(\#\mathcal{L}) \longleftrightarrow \neg \mathcal{L} *$ 

### The Liar Paradox

#### $\mathfrak{L}$ : The Sentence $\mathfrak{L}$ is Untrue.

Or,  $\mathfrak L$  is True if and only if  $\mathfrak L$  is Untrue. So,  $\mathfrak L \Longleftrightarrow \neg \mathfrak L$ Propositional Logic  $\vdash \neg (p \longleftrightarrow \neg p)$ .

#### Theorem (Tarski)

If all the formulas can be coded by some terms in a language  $\mathcal{L}$   $(\#\colon \mathcal{L}\text{-Formulas} \to \mathcal{L}\text{-Terms}, \varphi \mapsto \#\varphi)$  and the diagonal lemma holds for a consistent  $\mathcal{L}$ -theory T (for any  $\Psi(x) \in \mathcal{L}$ -Formulas there is some  $\psi \in \mathcal{L}$ -Sentences such that  $T \vdash \psi \leftrightarrow \Psi(\#\psi)$ ) then there can be no truth predicate in  $\mathcal{L}$  for T (an  $\mathcal{L}$ -formula  $\mathbf{T}(x)$  such that for any  $\varphi \in \mathcal{L}$ -Sentences,  $T \vdash \varphi \leftrightarrow \mathbf{T}(\#\varphi)$ ).

#### Proof

Take  $\mathcal{L}$  to be the diagonal sentence of  $\neg \mathbf{T}(x)$ . Then  $T \vdash \mathcal{L} \longleftrightarrow \neg \mathbf{T}(\#\mathcal{L}) \longleftrightarrow \neg \mathcal{L} *$ 

### The Liar Paradox

#### $\mathfrak{L}$ : The Sentence $\mathfrak{L}$ is Untrue.

Or,  $\mathfrak L$  is True if and only if  $\mathfrak L$  is Untrue. So,  $\mathfrak L \Longleftrightarrow \neg \mathfrak L$ Propositional Logic  $\vdash \neg (p \longleftrightarrow \neg p)$ .

#### Theorem (Tarski)

If all the formulas can be coded by some terms in a language  $\mathcal{L}$   $(\#\colon \mathcal{L}\text{-Formulas} \to \mathcal{L}\text{-Terms}, \varphi \mapsto \#\varphi)$  and the diagonal lemma holds for a consistent  $\mathcal{L}$ -theory T (for any  $\Psi(x) \in \mathcal{L}$ -Formulas there is some  $\psi \in \mathcal{L}$ -Sentences such that  $T \vdash \psi \leftrightarrow \Psi(\#\psi)$ ) then there can be no truth predicate in  $\mathcal{L}$  for T (an  $\mathcal{L}$ -formula  $\mathbf{T}(x)$  such that for any  $\varphi \in \mathcal{L}$ -Sentences,  $T \vdash \varphi \leftrightarrow \mathbf{T}(\#\varphi)$ ).

#### Proof.

Take  $\mathfrak L$  to be the diagonal sentence of  $\neg \mathbf T(x)$ . Then  $T \vdash \mathfrak L \longleftrightarrow \neg \mathbf T(\# \mathfrak L) \longleftrightarrow \neg \mathfrak L *$

## Russell's Paradox

The Set of All Sets that are not Members of Themselves

Is This Set a Member of Itself or not?

Theorem (Invalidity of "unrestricted" Comprehension Principle)

For some formula  $\varphi(x)$  there can be no set as  $\{x \mid \varphi(x)\}$ .

Proof.

Let 
$$\varphi(x) = "x \notin x"$$
.

Proof

$$\varphi(x) = \text{``}\exists y \big[ x = \mathcal{P}(y) \land x \notin y \big] \text{'`}$$
  
$$\varphi(x) = \text{``}\exists y \big[ x = y \times y \land x \notin y \big] \text{'`}$$
  
$$\varphi(x) = \text{``}\exists y \big[ x = \{y\} \quad \land x \notin y \big] \text{''}$$

## Russell's Paradox and Self-Reference

B. Russell, On Some Difficulties in the Theory of Transfinite Numbers and Order Types, *Proceedings of the London Mathematical Society* 4:1 (1907) 29–53.

Given a property  $\phi$  and a function f, such that, if  $\phi$  belongs to all the members of u [ $\forall x \in u : \phi(x)$ ], f'u [f(u)] always exists, has the property  $\phi$ , and is not a member of u [ $f(u) \downarrow \in \{x \mid \phi(x)\} \setminus u$ ]; then the supposition that there is a class w of all terms having the property  $\phi$  [ $w = \{x \mid \phi(x)\}$ ] and that f'w exists [ $f(w) \downarrow$ ] leads to the conclusion that f'w both has and has not the property  $\phi$  [ $\phi(f(w)) \& \neg \phi(f(w))$ ].

This generalization is important, because it covers all the contradictions [paradoxes] that have hitherto emerged in the subject.

University of Tabriz & IPM Talk I: Paradoxes and their Theorems http://SaeedSalehi.ir/ 1 June 2016

## Russell and Self-Reference

$$u \subseteq \{x \mid \phi(x)\} \Longrightarrow f(u) \downarrow \in \{x \mid \phi(x)\} \setminus u$$
$$w = \{x \mid \phi(x)\} \& f(w) \downarrow \Longrightarrow \phi(f(w)) \& \neg \phi(f(w))$$

### Russell and Self-Reference

$$u \subseteq \{x \mid \phi(x)\} \Longrightarrow f(u) \downarrow \in \{x \mid \phi(x)\} \setminus u$$
$$w = \{x \mid \phi(x)\} \& f(w) \downarrow \Longrightarrow \phi(f(w)) \& \neg \phi(f(w))$$

#### **Definition (Productive)**

A set A is *productive*, if there exists a (partial) computable function  $f: \mathbb{N} \to \mathbb{N}$  such that for every n, if  $\mathcal{W}_n$  (the n-th RE set) is a subset of A, then  $f(n) \downarrow \in A \setminus \mathcal{W}_n$ .  $\mathcal{W}_n \subseteq A \Longrightarrow f(n) \downarrow \in A \setminus \mathcal{W}_n$ 

Creative: a SEMI-DECIDABLE set whose complement is productive.

E. L. Post, Recursively Enumerable Sets of Positive Integers and their Decision Problems, *Bulletin of the American Mathematical Society* 50:5 (1944) 284–316.

"... every symbolic logic is incomplete ... . The conclusion is unescapable that even for such a fixed, well defined body of mathematical propositions,

mathematical thinking is, and must remain, essentially creative."

## Diagonal Argument and Self-Reference

K. Simmons, The Diagonal Argument and the Liar, J. Philosophical Logic 19:3 (1990) 277-303.

There are arguments found in various areas of mathematical logic that taken to form a family: the family of diagonal arguments. Much of recursion theory may be described as a theory of diagonalization; diagonal arguments establish basic results of set theory; and they play a central role in the proofs of limitative theorems of Gödel and Tarski. Diagonal arguments also give rise to set-theoretical and semantical paradoxes.

## Diagonal Argument and Self-Reference

K. Simmons, The Diagonal Argument and the Liar, J. Philosophical Logic 19:3 (1990) 277–303.

There are arguments found in various areas of mathematical logic that taken to form a family: the family of *diagonal arguments*. Much of recursion theory may be described as a theory of diagonalization; diagonal arguments establish basic results of set theory; and they play a central role in the proofs of limitative theorems of Gödel and Tarski. Diagonal arguments also give rise to set-theoretical and semantical paradoxes.

W. Hodges, An Editor Recalls Some Hopeless Papers, BSL 4:1 (1998) 1-16.

I dedicate this essay to the two-dozen-odd people whose refutations of Cantor's diagonal argument ... have come to me either as a referee or an editor in the last twenty years or so. ...

A few years ago it occurred to me to wonder why so many people devote so much energy to refuting this harmless little argument—what had it done to make them so angry with it? **SWAMPLANDIA 2016**

# Diagonal Argument Again (4)

### The Paradox of Well-Founded Sets

Sets Whose Every Membership Chain Finitely Terminates

$$Q_{\infty} = \{x \mid \neg \exists z_1, z_2, \dots [\dots \in z_2 \in z_1 \in x]\}$$

For 
$$F: A \to \mathcal{P}(A)$$
 Let

$$D_F^{\infty} = \{ x \in A \mid \neg \exists z_1, z_2, \cdots [\bigwedge_{i=1}^{\infty} (z_{i+1} \in F(z_i)) \land z_1 \in F(x) ] \}$$

$$D_F^n = \{x \mid \neg \exists z_1, \dots, z_n [x \in F(z_n) \land \bigwedge_{i=1}^{n-1} (z_{i+1} \in F(z_i)) \land z_1 \in F(x)]\}.$$

One can show that none of these can be in the range of F:

$$D_F^{\infty} \subseteq \cdots \subseteq D_F^{n+1} \subseteq D_F^n \subseteq \cdots \subseteq D_F^0 = D_F$$

#### The Paradox of Well-Founded Sets

Sets Whose Every Membership Chain Finitely Terminates

$$Q_{\infty} = \{ x \mid \neg \exists z_1, z_2, \dots [\dots \in z_2 \in z_1 \in x] \}$$

- S. YUTING, Paradox of the Class of All Grounded Classes, ISL 18:2 (1953) 114.

# Yablo's Paradox − 1st or 2nd Order? or non?

#### Is THAT IT?

L. M. Picollo, Yablo's Paradox in Second-Order Languages: Consistency and Unsatisfiability, *Studia Logica* 101:3 (2013) 601–617.

If we embrace the second-order notion of logical consequence we must subscribe to the idea that the second-order calculus is not powerful enough for representing Yablo's argument, and neither is the first-order calculus.

Is there a better (or just another) logic that represents Yablo's Paradox (and his argument)?

### YABLO'S Paradox as an LTL-Theorem

Talk II: Theoremizing Yablo's Paradoxes

$$\forall i \geq n : i \Vdash \varphi \iff i \Vdash \bigcirc \square \neg \varphi \iff i + 1 \Vdash \square \neg$$

A. Karımı & S. Salehi, Diagonal Arguments and Fixed Points, *Bulletin of the Iranian Mathematical Society*, to appear.

(Propositional) Linear Temporal Logic  $\models \neg \Box (\varphi \longleftrightarrow \bigcirc \Box \neg \varphi)$ .

Proof

If  $n \Vdash \Box (\varphi \leftrightarrow \bigcirc \Box \neg \varphi)$  for some model, then  $\forall i \geq n : i \Vdash \varphi \iff i \Vdash \bigcirc \Box \neg \varphi \iff i + 1 \Vdash \Box \neg \varphi.$ 

- (i) If for some  $j \geq n$  we have  $j \Vdash \varphi$ , then  $j+1 \Vdash \Box \neg \varphi$  and so  $j+\ell \not\Vdash \varphi$  for all  $\ell \geq 1$ . In particular,  $j+1 \not\Vdash \varphi$  whence  $j+2 \not\Vdash \Box \neg \varphi$  which is in contradiction with  $j+1 \Vdash \Box \neg \varphi$ .
- (ii) If for all  $j \ge n$  we have  $j \not\Vdash \varphi$ , then  $n \not\Vdash \varphi$  so  $n+1 \not\Vdash \Box \neg \varphi$ ; hence there must exist some i > n with  $i \vdash\vdash \varphi$  which contradicts (i)!

A. Karimi & S. Salehi, Diagonal Arguments and Fixed Points, *Bulletin of the Iranian Mathematical Society*, to appear.

(Propositional) Linear Temporal Logic  $\models \neg \Box (\varphi \longleftrightarrow \bigcirc \Box \neg \varphi)$ .

### Proof.

If  $n \Vdash \Box(\varphi \leftrightarrow \bigcirc \Box \neg \varphi)$  for some model, then  $\forall i \geq n : i \Vdash \varphi \iff i \Vdash \bigcirc \Box \neg \varphi \iff i + 1 \Vdash \Box \neg \varphi.$ 

- (i) If for some  $j \geq n$  we have  $j \Vdash \varphi$ , then  $j+1 \Vdash \Box \neg \varphi$  and so  $j+\ell \not\Vdash \varphi$  for all  $\ell \geq 1$ . In particular,  $j+1 \not\Vdash \varphi$  whence  $j+2 \not\Vdash \Box \neg \varphi$  which is in contradiction with  $j+1 \Vdash \Box \neg \varphi$ .
- (ii) If for all  $j \geq n$  we have  $j \not \Vdash \varphi$ , then  $n \not \Vdash \varphi$  so  $n+1 \not \Vdash \Box \neg \varphi$ ; hence there must exist some i > n with  $i \Vdash \varphi$  which contradicts (i)!

#### More (Non-)Fixedpoints of LTL

A. Karımı & S. Salehi, Theoremizing Yablo's Paradox, arXiv:1406.0134 [math.LO], http://arxiv.org/abs/1406.0134

#### **Proposition**

The operators  $x \mapsto \neg \Box x$  and  $x \mapsto \Box \neg x$  do not have any fixed-points in LTL; i.e., LTL  $\models \neg \Box (\varphi \leftrightarrow \neg \Box \varphi)$  and LTL  $\models \neg \Box (\varphi \leftrightarrow \Box \neg \varphi)$ .

#### More (Non-)Fixedpoints of LTL

A. Karımı & S. Salehi, Theoremizing Yablo's Paradox, arXiv:1406.0134 [math.LO], http://arxiv.org/abs/1406.0134

#### **Proposition**

The operators  $x \mapsto \neg \Box x$  and  $x \mapsto \Box \neg x$  do not have any fixed-points in LTL; i.e., LTL  $\models \neg \Box (\varphi \leftrightarrow \neg \Box \varphi)$  and LTL  $\models \neg \Box (\varphi \leftrightarrow \Box \neg \varphi)$ .

#### Proof.

If  $n \Vdash \Box(\varphi \leftrightarrow \Box \neg \varphi)$ , then for any  $i \geqslant n$  we have  $i \Vdash \varphi \Leftrightarrow i \Vdash \Box \neg \varphi$ . Now, by  $\models \Box \neg \varphi \rightarrow \neg \varphi$  we have  $i \Vdash \varphi \Rightarrow i \Vdash \neg \varphi$ , so  $i \Vdash \neg \varphi$  for all  $i \ge n$ . Thus, in particular  $n \Vdash \neg \varphi$ , and also  $n \Vdash \Box \neg \varphi, *!$ 

#### More (Non-)Fixedpoints of LTL

A. Karimi & S. Salehi, Theoremizing Yablo's Paradox, arXiv:1406.0134 [math.LO], http://arxiv.org/abs/1406.0134

#### Proposition

The operators  $x \mapsto \neg \Box x$  and  $x \mapsto \Box \neg x$  do not have any fixed-points in LTL; i.e., LTL  $\models \neg \Box (\varphi \leftrightarrow \neg \Box \varphi)$  and LTL  $\models \neg \Box (\varphi \leftrightarrow \Box \neg \varphi)$ .

#### Proof.

If  $n \Vdash \Box(\varphi \leftrightarrow \Box \neg \varphi)$ , then for any  $i \geqslant n$  we have  $i \Vdash \varphi \Leftrightarrow i \Vdash \Box \neg \varphi$ . Now, by  $\models \Box \neg \varphi \rightarrow \neg \varphi$  we have  $i \Vdash \varphi \Rightarrow i \Vdash \neg \varphi$ , so  $i \Vdash \neg \varphi$  for all  $i \geqslant n$ . Thus, in particular  $n \Vdash \neg \varphi$ , and also  $n \Vdash \Box \neg \varphi$ , \*!

#### Remark

Some other operators like  $x \mapsto \Box x$  or  $x \mapsto \neg \bigcirc x$  do have fixed-points;  $\langle \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \dots \rangle$  for the former and  $\langle \mathfrak{f}, \mathfrak{t}, \mathfrak{f}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \mathfrak{t}, \dots \rangle$  for the latter.  $\diamondsuit$
